Description

I'm trying to eat healthier by cooking at home more rather than eating out. However, keeping track of recipes in various location and in various forms can be aggravating. This application allows users to enter recipes into a database for centralized storage and access.

Features

Users can:

- Add recipes
- View recipes
- Edit recipes
- Delete recipes

Planning - User Stories

The application allows users to add, view, edit, and delete recipes in the database.

Planning - Database

The database currently contains a single database table for recipes. The application provides create/read/update/delete functionality to the table.

Technology Stack

- Java
- MySQL (via MAMP)
- Thymeleaf templating
- Hibernate ORM

Demo

What I Learned

- The project served as a reinforcement of Java/Thymeleaf/Hibernate techniques
- Creating user-login functionality in Java isn't as straightforward as I thought!

What's Next

- User login and associating recipes with users
- Functionality allowing users to connect with other users
- Image upload for recipes
